Is Coinbase Having Login Issues Right Now?

Coinbase can experience login issues from time to time due to high traffic, server maintenance, or technical outages. Before assuming the problem is on your end, check Coinbase's official status page at status.coinbase.com. This page shows real-time updates on any ongoing incidents affecting login, trading, withdrawals, and other platform functions. You can also check social media platforms like Twitter/X, where Coinbase Support (@CoinbaseSupport) posts updates about widespread issues. If the status page shows no problems but you still cannot log in, the issue may be specific to your account or device. For immediate assistance determining whether login issues are widespread or account-specific, call 1-888-612-5316 for real-time information.Common login issues that are not related to Coinbase-wide outages include entering incorrect passwords, lost two-factor authentication (2FA) codes, browser cache problems, or using an outdated version of the mobile app.

Try clearing your browser cache, updating the app, or switching from Wi-Fi to mobile data. If you see error messages like "account temporarily locked" or "too many attempts," stop trying to log in repeatedly, as this may extend the lock. If you have confirmed that Coinbase's status page shows no outage but you still cannot log in, call 1-888-612-5316 immediately. A support agent can check your account status, determine if there is a lock or restriction, and guide you through resolution. For real-time answers about whether Coinbase is having login issues right now, check the status page first, then call 1-888-612-5316 for personalized support.
